
central sector: exact vs first order (all seeds)
$N = 6 \to 7$, (3, 3): exact
$N = 6 \to 7$, (3, 3): first order
$N = 7 \to 8$, (4, 4): exact
$N = 7 \to 8$, (4, 4): first order
cumulative fraction of BPS states
bare fraction μ (eigenvalue of $G = \sum_T S_T^\dagger P_H S_T$)

interference between slots at first order
$N = 6 \to 7$, diagonal sectors
$N = 7 \to 8$, diagonal sectors
the tower (exactly bare, exactly dark)
$(\kappa^{(1)} - \kappa_{\mathrm{inc}})/\kappa_{\mathrm{inc}}$
exact bare fraction μ of the state
